# Switching Vendors: BI Group Reached The Break-Even Point Within 8 Months

After a successful RPA pilot with a top-tier **RPA platform** and two subsequent years of hyperautomation scaling, BI Group, the largest construction holding in Central Asia (with revenue exceeding USD 1 billion), faced an issue of escalating license costs. This led to the shelving of some potential tasks for **automation**.

Three months of piloting Python RPA by an internal RPA team led to the company's decision to completely transition to **Python RPA**. Thanks to unlimited bot licenses and affordable pricing, BI Group managed to reach the break-even point within 8 months and establish a new automation roadmap that included many small tasks for the accounting and operations departments that were not previously considered.

The development of the first bot with **Python RPA** took one month, facilitated by team training provided by the vendor's development team, which was included in the subscription.
